Don't you hate it when the sales rep doesn't know his grass from a hole in the ground? At Pennington, that's not the case. Pennington turf specialists are well-trained and knowledgeable about which grasses will best suit your turf requirements, water conditions, and climate. Not only that, they'll make sure that you get what you want when you want it. If it's Specialty Turfgrass that you need then it's Pennington Seed you need to call.

**PERENNIAL RYEGRASSES** - Pennington 240, Shining Star, Stallion Select, Morning Star, Sunrise 246

**PERENNIAL RYEGRASS BLENDS & MIXTURES** - Sunrise Primo, CBS II, Triple Play, Sunrise plus Poa Trivialis, Professional's Select, Fairway Classic, Sports Club Mix

**TURF TYPE TALL FESCUES** - Duster, Tradition, Virtue, Finelawn Petite, Finelawn 88, Enviro Blend, Triad Blend

**SEEDED TURF TYPE BERMUDAS** - Cheyenne, Yuma

Kubota's precision-cutting turf equipment cuts through your turf chores in less time, with less fuel, while delivering more power and versatility.

The heavy-duty, 2WD M4030SU turf/utility tractor is powered by a Kubota 51 horsepower liquid-cooled diesel engine. With standard features such as "creep speed" transmission (16 forward/16 reverse), hydrostatic power steering, wet disc brakes and an independent hydraulic system, this powerful special turf tractor can lift and move heavier loads and quickly attach/detach a variety of implements.

For the ultimate in maneuverability and versatility, the Kubota diesel front mower F-Series offers you hydrostatic transmission for quick, smooth operation. The 24HP F2400 and 20HP F2100 come with four-wheel drive and a front differential lock. The fuel-efficient, 2WD 20HP F2100E offers excellent visibility and power. And, the FZ2100 and FZ2400 with 20HP and 24HP offer the exclusive combination of Zero Diameter Turn (ZDT) and Auto Assist Differential (AAD) 4-wheel drive. Kubota has a wide selection of Kubota performance-matched implements such as rotary, flail and rear discharge mulching mowers.

Cut through your turf chores with a Kubota.

For more information on Kubota's versatile turf equipment that can increase your productivity, write to:

10 SEED PRIMING AND PREGERMINATION: MAKING TIME
Time is of the essence in sports turf management, and seed priming and pregermination can help speed new turf and overseeding establishment. While methods vary with pregermination, constants include frequent changing of water, maintaining adequate temperature and oxygenation.

16 1993 DIAMOND OF THE YEAR: THE GENOA HIGH ATTITUDE
When the Genoa High School baseball diamond fell into disrepair, coach Jeff Thompson, his staff and players, the school’s administration, and the entire community didn’t give up — they got busy. Their positive attitude and efforts made this northwest Ohio diamond a winner.

24 IRRIGATION EFFICIENCY: ATTENTION PAYS
From a simple catch-can test to check for distribution uniformity to matching precipitation rates of various rotors and heads, paying attention to irrigation system efficiency makes agronomic and economic sense.

31 WARM SEASON TURF RENOVATION: PROFILES IN EXCELLENCE
Budget and use drastically affect athletic field renovation practices, but with ongoing effort, excellence is possible in even high-use, low-budget facilities. Chris Bunnell, grounds supervisor for the Escondido Union School District and president of the Southern California Chapter of the Sports Turf Managers Association, details several diverse programs.

On Site with I-Series

Stainless Steel Risers

Easy Arc Adjustment
Through-the-top access changes arc from 40° to 360°.

Stainless Steel Risers
For longer life and reliable performance.

Model I-20
Best choice for high-end residential/light commercial.

Drain Check Valves
Saves water, reduces liability.

Model I-25
Ideal for commercial and recreational sites.

Model I-40
Used in stadiums and ballparks worldwide.

Top Performers in Tough Conditions

Five Year Warranty
Hunter I-Series rotors with stainless steel risers are the team to rely on when your agenda includes rough soil conditions, vandalism and player safety.

They're built like linebackers and are just as tough. Reliable gear drives deliver years of trouble-free operation, and heavy-duty retraction springs ensure positive pop-downs and greater player safety.

Use the Hunter I-40 on your best big-time jobs, from sports fields to industrial parks. Use Hunter I-20s and I-25s on high-end residential and mid-size commercial sites.

It's the turf team that goes the distance.

Hunter offers a complete line of irrigation products for turf and landscape, including rotors, sprays, valves and controllers.

Interchangeable nozzles, rugged construction, and easy on-site adjustment make the I-Series ideal for sports fields.

Dedicated To The Irrigation Professional

Going In Style

With players’ salaries gone far beyond ludicrous, their disdain for fans skyrocketing, and their Superstar egos matched only by those of the owners, it’s nice to see that something in Major League Baseball is getting better.

Ballparks. Today’s Major League ballparks are being designed and built with the fan, as opposed to the seating capacity, in mind. Two real, natural turf gems opened this season — the Cleveland Indians’ Jacobs Field and The Ballpark at Arlington, home of the Texas Rangers. Both venues seat far less than the average park constructed in the 1960s and 1970s.

While I haven’t visited either Jacobs Field or The Ballpark at Arlington, by most accounts they have grace and style similar to Camden Yards in Baltimore or Comiskey Park in Chicago. All four parks were designed to recapture the historic look and feeling of classic diamonds, such as Wrigley Field.

Two groups are served by this “nostalgic” trend. First, the fans are treated to a game played in a more intimate, much smaller venue. The “worst seat in the house” at Jacobs Field or The Ballpark at Arlington is better than the average seat at many domes and stadiums.

Perhaps most importantly, the field is not an afterthought in the new “classic” parks. This may be a positive by-product of today’s finicky, professional Superstar ball player, who wants only the best surface and facilities, and the owners, who may be starting to realize that a safe surface is one of the best insurance policies against injuries to high-priced stars. It’s no accident that the two newest fields in Major League Baseball are natural turf.

Third, the ballpark owners and surrounding businesses will benefit through better attendance. Who wouldn’t want to watch a game at one of these intimate venues?

For the sports turf industry, these parks are good omens indeed. Any highly visible improvement in the industry also elevates it a notch. You’d expect the kind of press Jacobs Field and The Ballpark at Arlington received from Sports Illustrated, but the fact that the Wall Street Journal chose to cover their openings in a March issue is quite significant.

More and more, from Little League to Major League, from Pop Warner to the NFL, fields are beginning to matter, as do the professionals who care for them. They’ve been important all along, yet it’s taken time for the decision-makers at the professional level to see beyond the bottom-line, or to understand that an intimate venue, coupled with an outstanding natural surface cared for by a first-rate professional, can actually improve it.

Matthew Trulio
Combine three of the best turf-type tall fescues available, and you've got a powerful blend — TRIPLET, from Jacklin Seed. TRIPLET's semi-open canopy and improved resistance to diseases like brown patch and net blotch help it thrive. As a result, TRIPLET gives you a deep-green, medium-textured dense turf that stands up to heat, drought and close mowing. All of which make it a perfect choice for xeriscaping, golf courses, residential and business park lawns, playgrounds, parks and athletic fields. Plus, TRIPLET is the first Green Seal Quality approved blend. That means each variety in TRIPLET has been selected for improved genetic characteristics and has met quality standards higher than certified seed. Add up the benefits for yourself. Ask for TRIPLET from your Jacklin Seed distributor. Or call 800-688-7333 for the name of the distributor nearest you.
Introducing a new series of options in SPORTSTURF AERATION

* The Gas Powered Air-Ject walk-behind unit with Coring Tines, Bannerman Slittertines or Aerway Shattertines

* 4-ft. Multi-Ject 400 - Tow-behind or 3 pt. hitch with Coring Tines, Bannerman Slittertines or Aerway Shattertines

* 6-ft. Super-Ject 600 - Tow-behind or 3 pt. hitch with Coring Tines, Bannerman 7-inch Slittertines or Aerway Shattertines

Here's more than a dozen ways you can benefit from A touch of sportsturf magic

Gordon Bannerman Limited • 41 Kelfield Street, Rexdale, Ontario, Canada M9W 5A3 • Telephone 416-247-7875 • Fax 416-247-6540
The Multi-Ject 400 and Super-Ject 600 offer a broad range of aeration options as illustrated on this page.

1. Coring tines towed by 3-wheeler, transport wheels up
2. Slittertines transport position on Cushman
3. Slittertines 3 pt. hitch on Cushman
4. Coring tines towed by 3-wheeler, transport wheels up
5. Aerway Shattertines tow behind on tractor

You've never had this kind of flexibility and choice at such affordable prices. Would you like to see a live demonstration on your own turf?

SEED PRIMING AND PREGERMINATION:

Making Time

By Matthew Trulio

Of all the shortages you can face as a sports turf manager, from staff, to budget, to equipment, perhaps the greatest one is time. There never seems to be enough of it. That's particularly true for high-use facilities. By the time one event begins, you're looking to the next, which could be a week or so away, or even the next morning. Your goal is to provide the best natural surface possible within the constraints of time and resources. And while neither is a cure-all, or even worth pursuing in all situations, seed priming or seed pregermination can help you reach that goal.

Although the terms priming and pregermination are often used interchangeably, they're decidedly different. According to Dr. Doug Brede of Jacklin Seed, seed priming is a pre-plant process that gets seed ready to grow before it "hits the ground." The process involves partially wetting the seed, allowing it to progress through several steps of germination, and then drying it back for planting. Priming takes the seed past the innate dormancy mechanisms that prevent or slow it from germinating when conditions are less than ideal.

Pregermination is process of germinating seed in a tank of water before sowing, Brede explains. After pregermination, roots have already broken the seed coat and an occasional leaf blade may be seen. Pregerminated seed demands immediate planting or the seed withers and dies.

In seed priming, the quantity of water fed to the seed during treatment is more limited than in pregermination. The seed doesn't receive enough water to fully germinate, so roots and shoots do not emerge. However, enough water is provided to get the seed started through the initial physiological steps of germination.

"There are a lot of different techniques people use for pregermination, but they all begin with soaking the seed in water," explains Nick Spardy, a turf consultant for Wilbur-Ellis based in San Diego, CA. "The goal is to create an ideal environment with adequate moisture, temperature, and oxygen where the seed is ready to germinate. Either the seed has started to swell or the cotyledon has actually emerged.

"In priming, the same concept is applied, but the process is stopped well prior to germination," he continues. "The seed may be swollen, but the cotyledon is far from emerging."

Most priming efforts, Spardy explains, are performed in the laboratory. The "tricky" part of the priming, he notes, is not just stopping the process, which requires precise timing, but storing primed seed. However, a number of companies are working on releasing primed seed varieties. (Check with individual seed companies or distributors for availability.)

In the field, seed pregermination tends to be a more commonly used technique for speeding turf establishment. In its most simple form, the basic process involves soaking the seed in water, oxygenating the water, changing the water and, once the cotyledon has emerged, "drying" the seed (although allowing it to dry completely would kill it). The pregerminated seed is then applied to the field.

"There are a lot misconceptions regarding seed priming, and everyone has their own ideas," says Spardy, who did his senior project on the subject under the guidance of Dr. Kent Kurtz at Cal Poly Pomona. "One thing we found to be a constant in both germination speed and rate, was keeping the water between 75 and 80 degrees F. Changing the water every three hours, which is optimum, to eight hours is important, because continued on page 14
