**TYPAR® TURF BLANKETS**

Typar® Turf Blankets retain warmth, which enhances germination and growth and helps protect turf from winterkill. The blankets also protect from wind and desiccation, retain moisture and allow sunlight, air and water through to the soil. Made of spun-bonded polypropylene, Typar Turf Blankets are tough, durable and tear resistant.

**PRO'S CHOICE - SOILMASTER**

Designed to meet the challenges of wet, dry and compacted infield conditions, SOILMASTER, a unique kiln hardened mineral contains a carefully balanced mixture of highly absorbent particle sizes. This desired blend of course-to-fine granules creates a porous soil profile for better drainage, quick absorption of excess water and improved infield playing conditions. Along with the White Sox, SOILMASTER, is also the choice of the Brewers, the Yankees, the 97 Champion Marlins and many other major and minor league teams.

For a truly effective and long lasting infield conditioner make your choice the PRO'S choice......

**Jaydee Drive Liner**

The Jaydee Drive Liner is a self-propelled riding line marker. The 35-gallon paint tank carries enough marking material for a complete game field, or several practice fields. The 2-gallon flush tank cleans the discharge lines for work breaks, travel, or overnight. The center or side-mark spray shields are always operator-visible. A nearly zero turning radius reduces or eliminates back and turn maneuvers.

FAX BLAST
The Horticulture Industry's new Fax Blast Program is a quick and cost-effective way to:
- Announce a new product or service.
- Sell an overstocked item.
- Remind your customers about a business or professional meeting.
- Induce your customers to attend a trade show.
- Promote a booth or social event.
- Inform customers about the favorable reviews your company has received.
- Send a publicity release.
- Survey your customers' needs.

Reach more than 35,000 magazine readers from Irrigation Journal, Outdoor Power Equipment, Arbor Age, sportsTURF and Landscape & Irrigation who buy and use the products and services that you offer. Target your marketing efforts by tailoring the list by the magazine readers' job title, type of business and by state. Find out how you can fax your one-page message to your best prospects by calling Amara Kanadyenge at 847/427-2039 or fax 847/427-2037 for more information.

ASSOCIATION INFORMATION
Many East Coast sports field managers have been expressing the same drought-related concerns lately: "We have experienced severe lack of rain this summer, and now we are under water restrictions. Some restrictions call for no watering of our soccer and football fields. The fields have become so hard that we have had to cancel games. What can we do, and what should we expect in terms of grass recovery if it ever rains again?"

First, remember that rain can be very local. One town may receive no rain, while another town only 50 miles away may have several brief showers to keep the grass growing nicely.

On the other hand, certain parts of the country can experience more prolonged periods of dry weather that can lead to drought and water restrictions. It's difficult to predict which summers will be excessively dry, so in most cases it's warranted to treat each summer as if it's going to be a drought.

Here are a few tips to keep grass alive during dry summers:

- Mow as tall as possible to shade the ground and promote deep rooting. Mow cool-season grasses, like Kentucky blue, perennial rye, and tall fescue, at 2.5 to 3.5 inches.

- Warm-season grasses, like bermuda, tolerate dry conditions quite well. Mowing at 2.0 inches will help them during extended dry periods.

- Water deeply and infrequently during the spring and prior to dry conditions. This will allow your grass to harden off and survive without lush conditions.

- You must allow some wilting to occur between these deep, infrequent waterings. Slight wilting ensures aeration of the soil, increased rooting, and a physiological hardening of the plant to moisture stress.

- Signs that a field is beginning to wilt include: lingering footprints, rolled or folded leaves, and a purple/blue cast to the field. When these signs begin to become evident, wet the soil to a depth of about six to eight inches. Watch the grass recover, and don't water until the field has begun to wilt again.

- Bermudagrass fields tolerate drought better than any of the cool-season grasses. They recover faster once water is returned to the field.

- Perennial ryegrasses receive the most damage when fields are left to go brown or summer dormant without irrigation. Many fields that contain a high percentage of perennial ryegrass from continuous over-seeding will likely experience substantial turf loss.

- Kentucky bluegrass recovers from summer dormancy in most cases. However, when the ground is so dry that it begins to crack open, expect some loss of Kentucky bluegrass.

- Tall fescue is the most drought-tolerant grass because of its deep root system. However, it can become quite clumpy as it recovers from severe drought.

Be prepared to interseed grass back into the field as soon as adequate moisture is available. Coring and drill seeding will help get the grass started again.

Seed before, during, and after the fall season. Seed is fairly inexpensive, so I suggest you continue to seed during the fall playing season to ensure as much coverage as possible for next year.

"Is there anything we can do to make our hard, dry fields more playable during the drought?"

This is a tough question. Floyd Perry once reminded me that if all you have to play on is a worn-out field with compacted soil, then you need to make the best dirt possible. The best way to accomplish this is to loosen the soil through aerification.

Your goal is not to get air to the roots, it's to make the field softer. Use whatever aerification equipment you have if it will go into the hard ground.

Shatter-core aerifiers do the best job of loosening fields that have been hardened by dry conditions. Their tines penetrate the ground and use shaking action to fracture and loosen the surface.

This type of equipment also works well on hard, dry skin areas of baseball and softball fields. You can loosen the field and play on it the same day.

Summer aerification is not typically recommend for general turf. But if you're desperate to make the field softer and safer, it may be your only solution.

David D. Minner, Ph.D., is an associate professor with the Department of Horticulture at Iowa State University. He serves on STMA's Certification Committee. Send your questions to Dave at: ISU, Hort. Dept., Ames, IA 50011; or call: (515) 294-2751, fax: (515) 294-0730, or e-mail: dminner@iastate.edu.
