

Diamond Pro
Vitrified Clay – 150 x

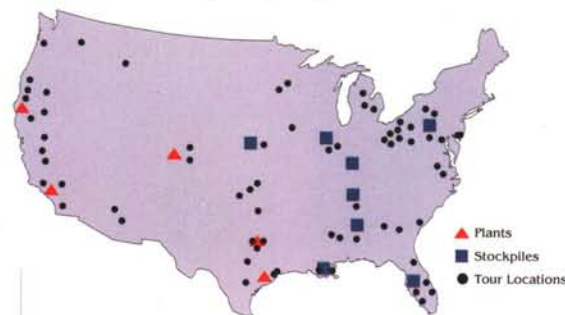

Calcined Clay – 150 x

We like to punch holes in our competition's claims.

You may have been told that calcined products make better infield conditioners. But when you look closer, you can see that Diamond Pro's vitrified clay is significantly more porous. It increases drainage and reduces compaction in skinned areas. And when you get bulk shipments of Diamond Pro from one of our nationwide distribution sites, you can save up to 50% over bagged calcined clay products. An even greater value when you consider that Diamond Pro won't break down and blow away like calcined clay. That explains why eleven major league teams and thirteen out of sixteen college regional tournament sites use Diamond Pro to maintain the game readiness of their playing fields.

At Diamond Pro, we handpick our distributors to bring our customers the highest quality of service and value-added products. See for yourself during the Diamond Pro National Tour. Once you've seen Diamond Pro at work, you realize that what the competition says just doesn't hold water.
