Making Its Mark!

FieldLazer™ hits a home run in sports field marking.

The revolutionary NEW FieldLazer™ features:

- Airless technology for spraying higher concentrations of paint, delivering brighter, longer-lasting lines.
- Siphon paint from its original container, eliminating the hassle of cleaning tanks and pots.
- Tall wheel cart is lightweight and rolls easily over rough terrain.
- Amazing versatility in a user-friendly package.

Call us at 800.690.2894 for more information, or visit us at www.graco.com
'iron-body' heads. Rubber covers are the standard for protecting the athletes. Plastic has become the industry standard.

"We always use swing joint assemblies on sports turf applications, unless a client insists on spray heads outside of playing area, then we might go to a different riser."

**ST: What about design? What are some of the key design elements in selecting and placing sprinkler heads?**

**JB:** "Always keep equipment away from high activity areas, sprinkler heads and other irrigation equipment should in no way interfere with the field of play. For example, you don't want heads placed on the home-plate side of first base, rather on the second-base side. You don't want an athlete to slide into any base and catch a sprinkler head.

"And, you never want valve boxes in the field of play. Typically, the boxes are buried under a warning track, so they don't interfere with 'traffic' and they provide a cleaner presentation. If that's not possible, I like to spec them outside the fence.

"We use predominantly part-circle arcs, because clay is very unforgiving when over watered. A critical area is the outfield lip. This seems to be the most dangerous location for heads. There's a tendency to groom the skin and push 'leftovers' out onto the grass when grooming. Over time this builds a lip along that line, which can affect sprinkler performance. Also, balls tend to hit and careen off that lip so you don't get a true play, which makes it dangerous to the outfielder.

"So you design to water the skin and the outfield differently, with two different zones. You have to isolate the irrigation system for the lip from rest of the turf. This is the most critical liability issue in baseball."

**DM:** "Head placement has to be a key design element. You have to strike that balance between the injury aspect and effective coverage. We use as few sprinklers as possible to achieve good coverage uniformity. We use part circles around the field perimeters, and adjust distribution arcs for the baselines, to avoid overspray. We want to keep the baselines as dry as possible, but there will be some water along the edges to ensure proper sprinkler coverage."

"Irrigation control is critical, so we design valving for the laterals to provide as much control as possible around the crown of the infield, and then valve the warning tracks and the sides separately. We also try to provide separate control valves that allow the turf manager to isolate right, center and left field."

**ST: Tell me about head placement. Is the there an accepted industry standard on where heads should be placed on the diamond?**

**JB:** "The industry pretty much has come to a standard approach. The standard head placement seems to be one head at each corner of the diamond, and one behind the pitching mound, all large rotors. Outfields vary in size and perimeter, so you have to design irrigation for those individually.

"Invariably, you'll find that you have to sublimate compromise somewhere in your head spacing. So we strictly adhere to standard spacing of the outside heads. Then, we start in the center of the field and work a triangular grid pattern out toward the edges, and where you give it up is where the edge meets the center field pattern. If you're going to compensate coverage uniformity, add sprinkler heads and re-space, don't short the heads and get hot spots.

"I should say, too, that it's fundamental to only use equipment recommended by manufacturer for that use. If you spec or install big golf heads with a high pan size, and someone gets injured, it's your problem. Sprinkler heads for sports turf facilities are designed for safety and performance. Remember, injury prevention absolutely is the greatest concern."

**DM:** "There is a relative standard to the size and configuration of baseball fields. Generally, part-circle sprinklers around the perimeter of the outfield, and a two- or three-row system for the full-circle sprinklers perform best. In most cases we provide a high-speed rotary system to syringe the infield mix, which enables the turf manager to drag out the infield. Placing heads in a turf infield, we usually split the difference between the bases along the baseline. That's four heads in the infield. There's some overspray, but it minimizes conflicts with the athletes and maintains a safe playing surface. We also try to avoid placing sprinklers where base runners will be..."
rounding the bases. Give 'em space.

"We typically try to provide a mainline loop outside of the ball field fence, then run laterals under the fence and warning tracks. Usually, there's a quick coupler behind the pitcher's mound for hand watering. Valve boxes are placed outside the fence wherever possible, or flush against the bottom of the fence.

"So, we do have kind of a process to laying out a field, but it really depends on the field. We try to design the system where one side of the field mirrors other - left field and right field. It's easier to stake and install that way, too. We try to minimize sprinkler heads and maximize coverage and control."

ST: What should a sports turf manager look for in a design and installation?

JB: "Sports fields are layered-growing-medium systems. They're constructed very deliberately with gravel, sand, a rootzone, and turf. An irrigation consultant and contractor have to understand that. These field systems are much more surgical. You don't want to contaminate what they've created. I think it's critical that all professionals involved have experience in these types of installations; they require different irrigation equipment and design.

"A good design and installation is more important than the variability of products on the market. If you design properly around a quality piece of equipment, system performance is built in. So, look at the support of the irrigation distributor. Who's got your back? Who's going to run out at 11 at night and get you a head or a valve? We tend look at those items and issues.

"The goal of any irrigation system is to apply the minimum amount of water necessary to finish the job. Put as little down as needed to accomplish what you want to accomplish. For baseball parks, you combine that with minimizing the irrigation equipment on the field, for safety."

DM: "For a performance irrigation system, look for a consultant who has experience in sports turf applications and is familiar with available products. Because needs vary from site to site, they really should select equipment that has good local manufacturer support and is specifically designed for a sports turf application. And, the designer shouldn't use a cookie-cutter approach. The irrigation consultant and contractor should understand the game of baseball, how it is played, where the players stand, move and run, as well as how the field typically will wear. They should put a premium on the safety of the players."
A new Toro irrigation system was part of an overall turf renovation project at Fenway Park late in 2004, which began with the excavation of 16.4 million pounds of soil. The upgrade was prompted by a number of concerns, including improved safety and playability of the surface, but also because the turf-grass had been so demanding to grow.

"That turf had certainly served its time, but it was old, and built like fields used to be built," said David Mellor, Director of Grounds at Fenway. "We had no automatic irrigation and very limited drainage. It was a heavy soil, so once it reached its capacity of water retention, there was no place for the water to go. It was a challenge to have the proper amount of water, especially in that soil."

Mellor chose Toro because of his long-standing relationship with the company and his local distributor, Turf Products Corp (TPC).

Toro's TR70XTP series rotors were installed in the outfield surface. Other shorter-radius rotors and spray heads were installed around uniquely shaped parts of the Fenway field, such as the bullpens and foul areas.

For its zone valves, Mellor chose 220 Series Brass with EZ-Reg pressure regulation to maintain matched pressure throughout their field and obtain the most uniform application. A Custom Command Series 36-station metal controller controls the entire system.

"It's like night and day," said Mellor. "With the flexibility, the throw pattern, being able to adjust its arcs, it certainly helps with the uniqueness of an athletic field layout. The field will be healthier because of the efficient and more uniform application of water dispersing from the heads versus hand watering... also having an automated system that comes on at 2 or 3 in the morning, or being able to syringe something on a hot day will help increase our efficiency."

Renovating the surface and improving the drainage also enabled Fenway to remove the crown in the field - something once common on such playing surfaces. "We have a flat infield and center field now," said Mellor.

THE BARENBRUG ADVANTAGE

RTF is an advanced generation of the turf-type tall fescue that produces a thick rhizome based root system that supports unparalleled thick turf. Turf that actually repairs itself when damaged.

The Key is in the rhizomes.

The new RTF rhizome technology actually fills in damaged bare spots and produces a more attractive, uniform turf area.

If your goal is world class turf in an environment of divot prone golfers, cleat-first sliding soccer players or even over active children on a home lawn, RTF is the advanced solution that comes to the rescue.

If it's Rhizomatous Tall Fescue, it must be RTF. So unique it's recognized with a patent.

With RTF Fun Doesn't Come at the Expense of Your Turf

U.S. Patent No. 6,677,507
**SMART DIAL CONTROLLER**

Irritrol Systems' new Smart Dial controller introduces evapotranspiration (ET)-based irrigation control technology that reacts to local weather conditions. Smart Dial features a WeatherTRAK-enabled interface that allows each zone to be programmed based on site-specific information, such as plant material, type of irrigation head installed, sun exposure, topography and soil type. Once programmed, the Smart Dial saves water by adjusting the irrigation schedule based on local weather data downloaded daily via satellite through the ET-Everywhere Data Service (a 2-year subscription to ET-Everywhere is included with new controllers).

For information, circle 054 or see http://www.oners.ims.ca/4571-054.

**NEW SINGLE-SITE SOFTWARE**

Rain Bird introduces SiteControl Version 2.0, the latest version of its single-site, commercial central control product line, featuring new water management features designed to enhance plant conditions, conserve resources and save money. Version 2.0 is now standard with all Rain Bird SiteControl packages. Product features RainWatch for SiteControl, a new water management tool that works with up to four Site Rain Cans to automatically pause and adjust run times according to measured rainfall. It also includes a Minimum ET capability that postpones irrigation until a minimum evapotranspiration threshold is reached, promoting deep watering for optimum turf conditions and water savings.

For information, circle 055 or see http://www.oners.ims.ca/4571-055.

**Pro's Choice SOILMASTER Select Series**

For premium performance and a color that will set your field apart, choose the Soilmaster Select Series from Pro’s Choice. Scientifically engineered to meet daily maintenance challenges and give your field a professional look, Soilmaster Select is the TRUE choice of groundskeepers around the league for building and maintaining winning ballfields. Available in four distinct colors, Soilmaster Select’s uniform granules manage moisture and alleviate compaction to keep your field in top playing condition. Pro’s Choice delivers a full line of sportsfield products for conditioning soil and infield mix, topdressing infield, quickly drying puddles and revitalizing turf.

For erosion protection, StormSlide, Inc. introduces the new solution for stormwater erosion for walkways and roads. StormSlide is a strong, lightweight, UV-protected polyethylene with a downdrain to channel surface water away. At only 3 lbs., the product is much lighter than metal products making it much easier to move and install, and has none of the metal products' hazardous points or edges. Its stackable design provides easy transport and the self-anchoring design means simple installation.

Fast acting. Long lasting. Extinguish Plus is the only dual-active bait that kills adult fire ant workers and sterilizes the queen.

Unsuspecting workers take the bait back to the mound as food, eat it and die. They also spread it to the queen—effectively eliminating colony growth and relocation. Extinguish Plus is fire ant ammo approved for indoor and outdoor use where fire ants are a problem.

Aim for superior results, reduced costs and dead fire ants. For more information, contact your local distributor, call 1-800-248-7763 or visit www.wellmarkinternational.com.

The Intelligent Use of Water™
Water. It's what keeps the world alive. As the world's largest manufacturer of irrigation products, we believe it is our responsibility to develop technologies that use water efficiently. Over the past seven decades, our pioneering efforts have resulted in more than 130 patents. From central control systems and automatic shut off devices to pressure regulating components and low volume drip irrigation, Rain Bird designs products that use water wisely. And our commitment extends beyond products to education, training and services for our industry and our communities.

The need to conserve water has never been greater. We want to do even more, and with your help, we can. Visit www.rainbird.com for more information about The Intelligent Use of Water.

SPORTSTURF FERTIGATION
Sports fields are becoming sports complexes, meaning heavy use and longer seasons. Fertigation can reduce labor and fertilization costs. Quick recovery from turfgrass damage and reduced irrigation water usage are additional important benefits gained from including fertigation in your new installation or adding it to your existing irrigation system.

QUICK COUPLING VALVES
Hunter Industries has introduced a new line of quick coupling valves that offer easy cross-compatibility with other brands. The new HQ line of quick couplers and keys has been engineered to work in tandem with or replace the Rain Bird, Toro, and Buckner quick couplers that so many sites already have.

Doubeday Field, named for the alleged father of baseball, won the 2004 Sports Turf Managers Association's Field of the Year in the Schools/Parks category. Owned and operated by the Village of Cooperstown, NY, home of course to the Baseball Hall of Fame, Doubleday Field is maintained by Joe Harris and Greg Lippitt alone, with some seasonal assistance in the summer.

Harris says the first official game was played on the site of the present stadium in 1920, and the grandstands that are there today were built in 1939. While the annual Hall of Fame (HOF) game featuring major league teams from each circuit gets all the publicity, Harris reports that normally three games a day are played on the field, seven days a week, except for about 4 days before the big leaguers come to town. Last year from April 10 through October 19 the field hosted 354 total baseball games, from Pony Leagues to high school ball to Legion games and semi-pro to over-40 league games.

Joe and Greg are the lifeblood of the facility; beyond the demands of turf management, they are responsible for all other aspects of maintaining Doulbeday Field, from painting to cleaning up debris. Joe says at one time the village provided him extra help for the HOF game but these days, it's just he and Greg.

Harris credits mentors such as City of Buffalo's head groundskeeper Jim Hornung and John Libardi of Heritage Park in Albany with teaching him the most about turf management, though he's also been through the well-known "School of
