Chapters Highlights

Profile: Oregon STMA

July was a busy month for the Oregon STMA. In addition to helping make the STMA Northwest Regional Conference a strong success, more than 25 chapter members participated in the chapter's first-ever field make-over. The chapter is less than two years old yet has 90 members and is growing.

The field make-over was at Alpenrose Dairy in Portland, which hosts the Little League Softball World Series. During the series, the Softball World Series Challenger Game is played. This game helps mentally and physically challenged youth enjoy the full benefits of Little League participation in an environment structured to their abilities.

The many hands of the Oregon chapter were able to sod cut high areas, re-grade and sod the back edges, foul base lines, home plate mound circle and coaches boxes.

The field that this game is played on is primarily for practice and often gets overlooked for consistent maintenance, so the goal of the field day was to get the field in excellent shape. The many hands of the Oregon chapter were able to sod cut high areas, regrade and sod the back edges, foul base lines, home plate mound circle and coaches boxes. The chapter also worked on the game day fields, primarily on the irrigation system.

In addition to the chapter's volunteers, the field day was directed by Little League Softball World Series Tournament Groundskeeper Mike Hebrard, Athletic Field Design, and had the commercial support of Ewing Irrigation, Oregon Turf and Trees, Pro Turf Solution, Profile Products, Target Specialty, EnviroLogic Resources, Portland Parks, Tualatin Hills Park and Recreation, Willamalane Parks, and other local citizens. Alpenrose hosted an ice cream social at the end of the work day. The Chapter was recognized for its field makeover during the Challenger game August 14.

Supreme-Green[™] **Turf Growth Cover**

Supreme-Green is a multi-purpose turf growth cover made of a specially designed material to provide early green-up, accelerated germination and winter protection. The Supreme-Green cover encourages root developement and rapid growth while extending your spring and fall seasons.

Supreme-Green turf growth cover is specifically engineered to promote earlier openings by 2 -3 weeks.

- Reduces seed loss
- Promotes earlier root establishment
- Accelerates Germination
- Reduces frost and
- ice-damage
 Porous to allow water and air circulation
- Mildew and rot resistent
- Quick turf repairs

Specifcations:

- · Made of tough wove en non-coated polyethylene material
- · UV treated for long life
- · Green tint for best heat build-up
- · One piece construction
- Comes complete with anchor pegs and storage bag

Questions?

Send them to Grady Miller at North Carolina State University, Box 7620, Raleigh, NC 27695-7620, or email grady_miller@ncsu.edu

Or, send your question to David Minner at Iowa State University, 106 Horticulture Hall, Ames, IA 50011 or email dminner@iastate.edu.

Is it too late?

We are about to finish our field and want to seed bermudagrass on August 23, is that too late? Raleigh, NC

Our new high school field will be finished in mid-August and ready for planting. Can we still plant bermudagrass sprigs or must we sod? We don't need the field until the middle of next summer.

Charlotte, NC

I have written several articles related to establishing turfgrass, but I mention the issue of timing. Establishment timing based on a date is an interesting topic because our extension publications always provide optimum situations. Our extension fact sheets indicate that in central North Carolina, the optimum planting date for bermudagrass is April to July.

Our publications do not say what will happen if someone plants after July or before April. It is logical to wonder what will happen if bermudagrass is planted in September or October. Like much in turf management, the answer is not black and white. The biggest unknown is weather, specifically the onset of cool weather and lower humidity—two situations that do not favor bermudagrass growth. The other factor that is working against you is decreasing day length.

Of course we have all experienced exceptions in weather. I remember once sprigging a bermudagrass green in Florida in late September and getting it fully grown in before the first frost. Even in Florida, that would not be a normal outcome of a late sprigging. It seems more often that weather works against you.

In the case of the fields in these questions, they are probably bare dirt at this point, so the field managers are "behind the 8-ball" in needing something on the ground before wind and rain erodes the rootzone.

So they need to know their establishment options to get the ground covered one way or another.

All plants have an ideal temperature range for seed germinating and plant growth. If the temperatures are just outside the optimum, then the seed will not germinate as quickly and the resulting plant may not grow as vigorously. This is generally not a big deal. The question then becomes, is there adequate time to complete the grow-in before the first frost? But get too far outside the optimum range, and nothing may happen, no germination and no growth.

To answer the questions sent to me, the bermudagrass seed should germinate and the sprigged field should see growth. But do not expect significant turf coverage before the first frost.

It is generally recommended that soil be at least 65 degrees (optimum is 75 to 80 degrees) before planting. If the soil temperature at 1-2 inches is less than 60 degrees, do not expect germination. Sprigs should tolerate a slightly wider range of temperatures because of energy reserves in the living material. In much of North Carolina, soil temperatures are above 65 degrees in September and in many areas into October. Research reported in an Applied Turf Science paper estimated that with normal temperatures and good cultural practices, seeded bermudagrass planted as late as August 9 in Nashville, TN should have 95% coverage by October 1.

From August 9 until October 1, that is 55 days until 95% coverage. I would consider that a good grow-in rate in the transition zone. My normal response when asked how long it takes to grow-in bermudagrass (seed or sprigs) is 45 to 90 days. Under ideal conditions, with irrigation and good cultural practices, it should be on the lower end of the range. Under

less than ideal conditions and no irrigation, full establishment is normally closer to the upper end of the range. Of course if you get no rain, then there is no germination or growth.

Unfortunately, seeding 14 days later (Aug 23), does not guarantee that 95% cover will be achievable by October 15. Much of the lateral growth of bermudagrass stops when the soil temperatures drop below 60 degrees. One way to cheat and extend the growing season several weeks is by using covers.

I would not normally recommend a late August planting, but if the field is bare it is probably a good risk to take, hoping for the best.

Some coverage is often better than none. But be ready with a back-up plan.

Outside of using covers, my suggestion would be to have some ryegrass seed on hand to overseed if it gets late in the fall without adequate bermudagrass cover. Annual ryegrass is cheaper and seems to establish better later in the year than perennial ryegrass. But perennial ryegrass provides higher quality surface in the spring and is easier to chemically remove. In this situation, annual ryegrass usually wins. My suggestion is to keep the rate as low as practical. Less if the field will not be used until summer, more if it may get some late spring use. Between 5 to 10 pounds of seed per 1000 square feet is usually adequate.

Remember the goal is to hold the soil in place while minimizing the competition for the bermudagrass. Do not let the ryegrass grow unchecked, or you may find it shades out your bermudagrass in the spring. With some luck, you can complete your grow-in in the spring and the field will not require re-seeding or re-sprigging.

(IN THE TIME IT TAKES TO MAKE TOAST)

New Talstar® XTRA granular insecticide eliminates fire ants in as little as minutes.

Formulated with the addition of zeta-cypermethrin, a proprietary, all-new active ingredient, Talstar® XTRA granular insecticide wipes out dangerous fire ant colonies in record time. Patent-pending Talstar XTRA quickly pierces an insect's cuticle and disrupts its central nervous system, for total colony elimination (kills the queen) in four hours or less. And in trials, Talstar XTRA achieved complete control in mere minutes — eradicating the threat posed by fire ants sooner than you ever thought possible.

Broad-spectrum Talstar XTRA also delivers fast knockdown and kill of most ants, chinch bugs, fleas, ticks, mole crickets and dozens of other lawn pests. And because it's Talstar, you know you'll also get the residual of the number-one trusted brand in general pest control, with four months or more of lasting protection.

For more information on the next generation of Talstar, visit www.fmcprosolutions.com or contact your FMC Sales Representative or local FMC Distributor.
