

# The Enkaturf® System: A One-Time Prescription For Worn-Out Playing Fields.

*With the Enkaturf system, grass can thrive where it needs to work the hardest. Our black 3-dimensional matting anchors roots and protects them against surface abuse and compaction.*

The 50-yard line doesn't have to disappear in ankle-deep mud. And golf courses don't have to wear out in areas of heavy traffic, either.

The Enkaturf system gets to the root of the problem of compacted or abused grass. And it definitely is not artificial turf.

Instead, it's a geomatrix of nylon that's placed about 1½" below the surface, filled with topsoil, and seeded or sodded. Grass roots lock into the matting, providing permanent me-

chanical stability. And the root zone is protected against compacting.

That's how Enkaturf has transformed many battered, muddy playing fields, golf courses, and playgrounds into tough, resilient natural surfaces.

You may have seen some of them. Perhaps the football stadium at Purdue or New Mexico State. Or Candlestick Park, where, only five days after Enkaturf was installed, the grass over it could not be pulled up. And of *Golf World's* list of 40 great golf courses, eleven have used the Enkaturf system.

So call us at (704) 667-7713 for the name of your nearest distributor.

Or write for a free sample and information kit to Geomatrix Systems, BASF Corporation Fibers Division, Enka, NC 28728.

Nothing works like our kind of black magic when you want to bring a natural surface back to life.
